

Stratux Radios (1090ES & UAT) Guide

Thank you for purchasing the **Stratux 1090ES & UAT Radio** kit.

Each unit is tested in a Stratux unit before shipping it to you. There hopefully should not be any defects. See some of the guidelines below to make sure you get off to a good start. If it doesn't work out for you, please contact me.

1. Make sure that your Stratux unit gets **sufficient power**. Use one of the recommended battery packs from <http://stratux.me>. Use the power cord that comes with the recommended battery pack – it matters!
2. This SDR kit does not come with antennas. You'll need a set of good antennas for good reception. Dmurray14 high gain antennas (found on Amazon also) are recommended.
3. The SDRs are pre-programmed to match with tuned antennas. The frequency is written on the USB connector (1090 or 978). Make sure to connect the device to the matching antenna.
4. If you have issues after troubleshooting, send me an email at products@stratux.me for help!
5. If you've had a positive experience with this unit and Stratux, please post a review on Amazon. If not, please send me an email and we'll work it out.

Thank you for supporting The Stratux Project!
Christopher Young
